Add WeChat edu_assist_pro

Problem 1. (10 points):

Part A

Fill in the blanks in the table below with the number described in the first column of each row. You can give your answers as unexpanded simple arithmetic expressions (such as $15^{213} + 42$); you should not have trouble fitting your answers into the space provided.

Remember that 32-bit floats have 8 bits of exponent and 23 bits of mantissa.

Description	Number
int $x=0$; float $*f = (float *) &x$; What is the value of $*f$?	
int x=-1; float *f = (float *) &x What is the value of *f?	
Smallest positive, non-zero denormalized 32-bit float	

Part B

Assume we are usual general tracking of the state of the

Fill in the empty boxes in the add below. Echant educations assist_pro

- State that it is true of all argument values, or
- Give an example where it is not true.

Puzzle	True / Counterexample
$(x >> 31) ^ ((-x) >> 31) == 0$	
x ^ ~(x >> 31) < 0	
$x ^ y ^ (x) - y == y ^ x ^ (y) - x$	
(((!!ux)) << 31) >> 31) == (((!!x) << 31) >> 31)	

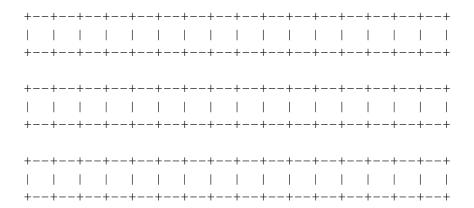

Problem 2. (8 points):

```
struct {
    char a[9];
    short b[3];
    float c;
    char d;
    int e;
    char *f;
    short g;
}
```

A. Show how the struct above would appear on a 64-bit ("x86_64") Windows machine (primitives of size k are k-byte aligned). Label the bytes that belong to the various fields with their names and clearly mark the end of the struct. Use hatch marks or x's to indicate bytes that are allocated in the struct but are not used.

B. Rearrange the above fields in foo to conserve the most space in the memory below. Label the bytes that belong to the various fields with their names and clearly mark the end of the struct. Use hatch marks or x's to indicate bytes that are allocated in the struct but are not used.

C.	How many bytes are wasted in part A, inside and after the struct, if the next memory value is a pointer?
D.	How many bytes are wasted in part B, inside and after the struct, if the next memory value is a pointer?

Problem 3. (12 points):

Consider the following two 8-bit floating point representations based on the IEEE floating point format. Neither has a sign bit—they can only represent nonnegative numbers.

1. Format A

- There are k = 4 exponent bits. The exponent bias is 7.
- There are n=4 fraction bits.

2. Format B

- There are k = 6 exponent bits. The exponent bias is 31.
- There are n=2 fraction bits.

Fill in the blanks in the table below by converting the given values in each format to the closest possible value in the other format. Express values as whole numbers (e.g., 17) or as fractions (e.g., 17/64). If necessary, you should apply the round-to-even rounding rule. If conversion would cause an overflow, follow the IEEE standard convention for representing +Infinity. You should also assume IEEE conventions for representing denormalized values.

Problem 4. (11 points):

Your friend Harry Bovik, who hasn't taken 15-213, is in need of your help. He was writing a function to do strange arithmetic for a project of his, but accidentally deleted his source code file, and also spilled his drink across the sheet of paper with his scratch work on it, leaving him with only half-legible code and an executable file that he compiled just recently. Being the clever student that you are, you ask to see his scratchwork and executable file.

```
int foo(_____ a)
{
    ____ b = 0;

switch (_____) {
    case 0:
    b = ____;

case 1:
```

}

Assignment Project Exam Help

```
case 2: https://eduassistpro.github.io/
b = _____;

___Add; WeChat edu_assist_pro

b = ____;

case 4:

b = ____;

return b;
```

Feeding the executable to your trusty debugger, you find the following relevant information:

```
(qdb) disassemble foo
Dump of assembler code for function foo:
0x0000000000400508 <foo+0>:
                                  mov
                                         $0x0, %edx

- 1. Unfortunately Harry's coretch work has breaktheed used to ha in every case, and he can't remember which cases are supposed to ha dump of his function, figure out which cases had breaks at the end of them. (Write either "break" or nothing at all in the last blank of each case block.)
- 2. The scratch work you were handed also failed to note what types a and b are, but fortunately some of the opcodes give it away. Figure out what types Harry meant for his variables to be.
- 3. Using the disassembly of foo and the jump table you found, reconstruct the rest of the switch statement.
- 4. What values will foo return for each possible input a?

Problem 5. (8 points):

Consider the following data structure declarations:

```
struct node {
  unsigned uid;
  union data d;
  union data d;
  struct node *next;
};

union data {
  int x[3];
  long y[3];
};
```

Below are given four C functions and five x86_64 code blocks, compiled on Linux using GCC.

```
int odin(struct node *ptr) {
                                              0x20(%rdi),%rax
                                         mov
 return (ptr->d.x[2]);
                                              0x8(%rax),%rax
                                         mov
}
unsigned dva(struct node *ptr) {
                                         mov
                                              0x10(%rdi),%eax
 return (ptr->uid = (long)ptr->next);
         ssignment Project Exam
                                              0xc(%rdi),%rax
                                         mov
long tri(struct nod
 union data *dhttps://eduassistpro.g
    (union data
  return dptr->y[1];
}
             Add WeChat edu
long *chetyre(struct node *ptr) {
                                              0x20(%rdi),%rax
                                         mov
 return &ptr->next->d.y[0];
                                         mov
                                              %eax, (%rdi)
```

In the following table, next to the name of each C function, write the name of the x86_64 block that implements it.

Function Name	Code Block
odin	
dva	
tri	
chetyre	

Problem 6. (12 points):

Below is some assembly code to a famous algorithm. Please briefly read the code then answer the questions on the following page.

```
0000000000400498 <mystery>:
  400498: 41 b8 00 00 00 00
                                       $0x0,%r8d
                               mov

}

return __Add WeChat edu_assist_pro
}
```

f) What famous algorithm is this?

Problem 7. (9 points):

Circle the correct answer. Assume IA32 unless stated otherwise.

1. Here is a small C program:

```
struct foo { int bar; int baz; };
int get_baz(struct foo *foo_ptr)
{
    return foo_ptr->baz;
}
```

After compiling the code, disassembling get_baz, and adding a few comments, we get:

```
get_baz: push %ebp ; save old frame base pointer
mov %esp,%ebp ; set frame base pointer
mov 0x8(%ebp),%eax ; move foo_ptr to %eax
-Mystery Instruction Goes Here-
leave
```

What is the stignment Project Exam Help

- (a) mov \$baz(%
- (b) mov 0x4 (https://eduassistpro.github.io/
- (d) mov 0xc(%ebp), %eax
- 2. The function bit Aiddard We Chat edu_assist_pro

```
int bitsy(int x);
```

and the (correctly) compiled IA32 code is:

```
bitsy: push %ebp
mov %esp,%ebp
sub $0x8,%esp
mov 0x8(%ebp),%eax
not %eax
inc %eax
leave
ret
```

What is the result (denoted here by a C expression) returned by bitsy?

- (a) !(x + 1)
- (b) *(1 x)
- (c) -x
- (d) (x > 0 ? -x : -x + 1)
- 3. Which of the following is true:
 - (a) There are no IEEE float representations exactly equal to zero.
 - (b) There is one IEEE float representation exactly equal to zero.
 - (c) There are two IEEE float representations exactly equal to zero.
 - (d) There are many IEEE float representations exactly equal to zero.
- 4. Which one of the following is true:
 - (a) Denormalized floats must be normalized before a floating point computation is complete.
 - (b) Denormalized floats represent magnitudes smaller than those of normalized floats.
 - (c) Denormalized floats signal a computation error or an indefined result He 1
 - (d) Denormalized floats represent magnitudes greater than those of normalized floats.
- 5. Why does the compiler s

n movl \$0x0, %eax?

- (a) Using xor https://eduassistpro.github.io/
- (b) The xorl form is faster and/or uses fewer bytes than
- (c) The mov1 form requires very to be accessed from them assist_pro (d) The xor1 form stalls the processor until the the result v
- (d) The xorl form stalls the processor until the the result v ruse by the next instruction.
- 6. On x86-64, addl %ebx, %eax has the following effect:
 - (a) %eax gets %eax + %ebx, high-order 32 bits of %rax are zeroed
 - (b) %eax gets %eax + %ebx, %rax is unchanged
 - (c) %eax gets %eax + %ebx, high-order 32 bits of %rax are sign-extended
 - (d) %rax gets %eax + %ebx

- 7. If %esp has the value 0xBFFF0000 before a call instruction, the value immediately after the call instruction (before the first instruction of the called function) is:
 - (a) 0xBFFEFFC
 - (b) 0xBFFF0004
 - (c) 0xBFFF0000
 - (d) The address of the instruction after the call instruction.
- 8. Which of the following is true:
 - (a) A function can immediately clear any "callee save" registers.
 - (b) The caller must always save *all* "caller save" registers before calling a function.
 - (c) The called function must immediately save *all* "callee save" registers on the stack and restore them before returning.
 - (d) A function can always ignore the initial values of all "caller save" registers.
- 9. Which of the following is true:
 - (a) A 32-bit IEEE float can represent any 32-bit integer to within 0.5.
 - (b) An Exponent is 0 and exp (the 8-bit exponent field) is E + bias = 127.
 - (c) No decimal inte

Problem 8. (6 points):

Consider the C code below, where H and J are constants declared with #define.

```
int array1[H][J];
int array2[J][H];
int copy_array(int x, int y) {
    array2[y][x] = array1[x][y];
    return 1;
}
```

Suppose the above C code generates the following x86-64 assembly code:

```
# On entry:
#
    edi = x
#
    esi = y
         ssignment Project Exam Help

```

What are the values of H and J?

H =

Extra Credit (4 points)

This problem is Extra Credit; do not attempt it until you have finished all other questions on the exam. This question is based on knowledge this class does not cover, and you are not expected to know how to solve it.

This problem deals with a tricky problem with GCC when run with high levels of optimization. This code in particular is compiled with

```
$ gcc -03 input.c
```

One of your friends who hasn't taken 213 comes to you with a program, wanting your help. They tell you that they have been debugging it for hours, finally removing all their intricate code and just putting a single printf statement inside their loop. They show you this relevant code:

Their code never breaks and runs in an infinite loop. You, being a 213 stude see the assembly dump: Add WeChat edu_assist_pro

Project

1. From the programmer's point of view, what is wrong with this assembly code?

https://eduassistpro.github.io/ Add WeChat edu_assist_pro

2. Why do you think gcc did this? (hint: we never mentioned this in class)

3. Please write the assembly code necessary to achieve the behavior intended by the programmer, and tell us where you would insert the code.
